LP Aero Plastics Announces New UV and Infrared Blocking Window Tints

LP Aero Plastics announces the addition of two new aircraft window tints available immediately for most of its non-pressurized aircraft product line.

These new UV-Green and UV-Solar Gray tints block over 99% of all UVA and 100% of the UVB radiation, and up to 30% more of the Near-Infrared radiation (heat) when compared to the standard Green and Solar Gray Tints.

The benefits are a healthier cockpit (less UV exposure for the human occupants) and less damage to interiors and avionics caused by exposure to UV and heat. These new tints can reduce aircraft interior temperatures by 10° - 20° or more, reducing the work load on air conditioning systems and the discomfort of the aircraft occupants.

The UV Green and UV Solar Gray tints have the same visible light transmittance as the standard Green and Solar Gray tints. They meet the requirements of FAR 23.775e and are interchangeable with the standard window tints.

For more information please contact LP Aero Plastics.
